Introduction to SDN

Muhammad Moinur Rahman
History of Networking

- Blackbox networking equipments
- Big name companies building switching/routing devices
- Includes Proprietary/OEM Silicon Chip
- Wrapped up with a closed source Operating System (e.g. A desktop PC with MS Windows and MS Office)
Disadvantages of Current Scenario

Technology was not designed keeping today in mind
- Massive Scalability
- Multi Tenant Networks
- Virtualization
- Cloud Computing
- Mobility (Users/Devices/VM)
Disadvantages of Current Scenario (Contd)

Protocols are Box Centric; Not Fabric Centric

- Difficult to configure correctly (consistency)
- Difficult to add new features (upgrades)
- Difficult to debug (look at all devices)
Disadvantages of Current Scenario (Contd)

Closed Systems (Vendor Hardware)
  ○ Stuck with given interfaces (CLI, SNMP, etc.)
  ○ Hard to meaningfully collaborate
  ○ Vendors hesitant to open up
  ○ No way to add new features by yourself

ANSWER: Software Defined Networking
What is SDN?

SDN is a framework to allow network administrators to automatically and dynamically manage and control a large number of network devices, services, topology, traffic paths, and packet handling (quality of service) policies using high-level languages and APIs. Management includes provisioning, operating, monitoring, optimizing, and managing FCAPS (fault, configuration, accounting, performance, and security) in a multi-tenant environment.
Networking Planes

● Data Plane
  ○ Carries Network User Traffic

● Control Panel
  ○ Carried Signalling Traffic

● Management Panel
  ○ Carries Administrative Traffic
SDN Architecture
Need for SDN - Virtualization

Use network resource
● without worrying about where it is physically located
● how much it is
● how it is organized
Need for SDN - Orchestration

Should be able to control and manage thousands of devices with one command
Need for SDN - Programmable

Should be able to change behavior on the fly
Need for SDN - Dynamic Scaling

Should be able to change size, quantity, capacity
Need for SDN - Automation

- To lower OpEx
- Minimize manual involvement
- Troubleshooting
- Reduce downtime
- Policy enforcement
- Provisioning/Re-provisioning/Segmentation of resources
- Add new workloads, sites, devices, and resources
Need for SDN - Visibility

Monitor resources, connectivity
Need for SDN - Performance

Optimize network device utilization
- Traffic engineering/Bandwidth management
- Capacity optimization
- Load balancing
- High utilization
- Fast failure handling
Need for SDN - Multi Tenancy

Tenants need complete control over their
- Addresses
- Topology
- Routing
- Security
Need for SDN - Service Integration

Provisioned on demand and placed appropriately on the traffic path

- Load balancers
- Firewalls
- Intrusion Detection Systems (IDS)
Alternative APIs

- Southbound APIs: XMPP (Juniper), OnePK (Cisco)
- Northbound APIs: I2RS, I2AEX, ALTO
- Overlay: VxLAN, TRILL, LISP, STT, NVO3, PWE3, L2VPN, L3VPN
- Configuration API: NETCONF
- Controller: PCE, ForCES
History

Feb, 2011 - OpenFlow 1.1 Released
Dec, 2011 - OpenFlow 1.2 Released
Feb, 2012 - “Floodlight” Project Announced
Apr, 2012 - Google announces at ONF
Jul, 2012 - Vmware acquires Nicira
Apr, 2013 - “OpenDaylight” Released
Hardware Internals

• Logical View of a Switch

• Physical Architecture of a Switch

![Diagram of a switch showing the logical and physical architecture with components such as Applications, Network O.S., ASIC, Processor, and Switching Fabric. The data plane and control plane are also indicated.](diagram.png)
Internals of SDN

- Southbound API: decouples the switch hardware from control function
  - Data plane from control plane
- Switch Operating System: exposes switch hardware primitives

</tr>
</tbody>
</table>

- Distributed protocols
  - Each switch has a brain
  - Hard to achieve optimal solution
- Network configured indirectly
  - Configure protocols
  - Hope protocols converge

- Global view of the network
  - Applications can achieve optimal solution
- Southbound API gives fine grained control over switch
  - Network configured directly
  - Allows automation
  - Allows definition of new interfaces
The SDN Stack

- Monitoring/debugging tools
  - oftrace
  - oflops
  - openseer

- Applications
  - ENVI (GUI)
  - LAVI
  - n-Casting
  - ...

- Controller
  - NOX
  - Beacon
  - Trema
  - FloodLight
  - RyU

- Slicing Software
  - FlowVisor
  - Console

- Commercial Switches
  - HP, IBM, NEC, Pronto, Juniper, and many more

- OpenFlow Switches
  - Software Ref. Switch
  - NetFPGA
  - Broadcom Ref. Switch
  - OpenWRT
  - PCEngine WiFi AP
  - Open vSwitch

# Dimensions of SDN Environments: Vendor Devices

<table>
<thead>
<tr>
<th>Vertical Stacks</th>
<th>Whitebox Networking</th>
</tr>
</thead>
</table>
| • Vendor bundles switch and switch OS  
  • Restricted to vendor OS and vendor interface | • Vendor provides hardware with no switch OS  
• Switch OS provided by third party  
  • Flexibility in picking OS |
| • Low operational overhead  
  • One stop shop | • High operational overhead  
  • Must deal with multiple vendors |
## Dimensions of SDN Environments: Switch Hardware

<table>

### Vendor Details

- **Arista**: OF + proprietary
- **Broadcom**: OF + proprietary
- **Cisco**: OF + proprietary
- **FloodLight**: OF, Underlay+Overlay, Whitebox
- **Juniper**: BGP+NetConf
- **Alcatel**: BGP
- **HP**: OF, Underlay, Vertical Stack
OpenFlow

● Developed in Stanford
  ○ Standardized by Open Networking Foundation (ONF)
  ○ Current Version 1.4
    ■ Version implemented by switch vendors: 1.3

● Allows control of underlay + overlay
  ○ Overlay switches: OpenVSwitch/Indigo-light
SDN vs OpenFlow

- Leading SDN protocol
- Decouples control and data plane by giving a controller the ability to install flow rules on switches (Bare Metal)
- Hardware or software switches can use OpenFlow
- Spec driven by ONF
How SDN Works: OpenFlow

Diagram showing the architecture of OpenFlow in SDN, with applications communicating with the controller through OpenFlow, and the controller interacting with the switch operating system (OS) through Southbound API.
OpenFlow: Anatomy of a Flow Table Entry

1. Forward packet to zero or more ports
2. Encapsulate and forward to controller
3. Send to normal processing pipeline
4. Modify Fields

Switch Port | VLAN ID | VLAN pcp | MAC src | MAC dst | Eth type | IP Src | IP Dst | IP ToS | IP Prot | L4 sport | L4 dport
---|---|---|---|---|---|---|---|---|---|---|---

Match | Action | Counter | Priority | Time-out

When to delete the entry
What order to process the rule
# of Packet/Bytes processed by the rule
# Examples

- Port 3
- Port 4

- 5.6.7.8
- 1.2.3.4
SDN Components : Hardwares

OpenFlow Compliant (1.0-1.4) Switch
● HP 8200 ZL, 6600, 6200ZL
● Brocade 5400ZL, 3500
● IBM NetIron
● Juniper OCX1100
● Baremetal Switch
● OpenVSwitch
SDN Components : Controllers

- OpenFlow Compliant (1.0-1.4) Controller
- POX: (Python) Pox as a general SDN controller that supports OpenFlow. It has a high-level SDN API including a queriable topology graph and support for virtualization.
- IRIS: (Java) a Recursive SDN Openflow Controller created by IRIS Research Team of ETRI.
- MUL: (C) MūL, is an openflow (SDN) controller.
- NOX: (C++/Python) NOX was the first OpenFlow controller.
SDN Components: Controllers (Contd)

- **Jaxon**: (Java) Jaxon is a NOX-dependent Java-based OpenFlow Controller.
- **Trema**: (C/Ruby) Trema is a full-stack framework for developing OpenFlow controllers in Ruby and C.
- **Beacon**: (Java) Beacon is a Java-based controller that supports both event-based and threaded operation.
- **ovs-controller** (C) Trivial reference controller packaged with Open vSwitch.
SDN Components : Controllers (Contd)

- Floodlight: (Java) The Floodlight controller is Java-based OpenFlow Controller. It was forked from the Beacon controller, originally developed by David Erickson at Stanford.

- Maestro: (Java) Maestro is an OpenFlow "operating system" for orchestrating network control applications.

- NodeFlow (JavaScript) NodeFlow is an OpenFlow controller written in pure JavaScript for Node.JS.

- NDDI - OESS: OESS is an application to configure and control OpenFlow Enabled switches through a very simple and user friendly User Interface.

- Ryu: (Python) Ryu is an open-sourced Network Operating System (NOS) that supports OpenFlow.
SDN Components : Controllers (Contd)

- NDDI - OESS: OESS is an application to configure and control OpenFlow Enabled switches through a very simple and user friendly User Interface.
- Ryu: (Python) Ryu is an open-sourced Network Operating System (NOS) that supports OpenFlow.
Demonstration Lab
Objectives

● Basics of running Mininet in a virtual machine.
  ○ Mininet facilitates creating and manipulating Software Defined Networking components.

● Explore OpenFlow
  ○ An open interface for controlling the network elements through their forwarding tables.

● Experience with the platforms and debugging tools most useful for developing network control applications on OpenFlow.

● Run the Ryu controller with a sample application

● Use various commands to gain experience with OpenFlow control of OpenvSwitch
Objectives (Contd)

- Run the Ryu controller with a sample application
- Use various commands to gain experience with OpenFlow control of OpenvSwitch
Topology

● Three hosts named h1, h2 and h3 respectively. Each host has an Ethernet interface called h1-eth0, h2-eth0 and h3-eth0 respectively.

● Three hosts are connected through a switch names s1. The switch s1 has three ports named s1-eth1, s1-eth2 and s1-eth3.

● The controller is connected on the loopback interface (in real life this may or may not be the case, it means the switch and controller are built in a single box). The controller is identified as c0 and connected through port 6633.

Mininet Environment

Running a high bandwidth flow

```
mininet> iperf
*** Iperf: testing TCP bandwidth between h1 and h2
Waiting for iperf to start up...***
Results: ['5.52 Gbits/sec', '5.52 Gbits/sec']
mininet>
```
Mininet Environment

Dump flows to see the flows which match

mininet> dpctl dump-flows -O OpenFlow13

*** s1 -----------------------------------------------------------------------------
