1

Border Gateway Protocol

- **Routing Protocol** used to exchange routing information between networks
 - exterior gateway protocol
- **Described in RFC1771**
 - work in progress to update
 - www.ietf.org/internet-drafts/draft-ietf-idr-bgp4-23.txt
- **The Autonomous System is BGP's fundamental operating unit**
 - It is used to uniquely identify networks with common routing policy

2

BGP

- **Path Vector Protocol**
- **Incremental Updates**
- **Many options for policy enforcement**
- **Classless Inter Domain Routing (CIDR)**
- **Widely used for Internet backbone**
- **Autonomous systems**

Cisco/ISPWorkshops

3

Path Vector Protocol

- **BGP is classified as a *path vector* routing protocol** (see RFC 1322)

A path vector protocol defines a route as a pairing between a destination and the attributes of the path to that destination.

12.6.126.0/24 207.126.96.43 1021 0 6461 7018 6337 11268 i

5

Definitions

- **Transit** – carrying traffic across a network, usually for a fee
- **Peering** – exchanging routing information and traffic
- **Default** – where to send traffic when there is no explicit match in the routing table

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

6

Default Free Zone

The default free zone is made up of Internet routers which have explicit routing information about the rest of the Internet, and therefore do not need to use a default route.

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

7

Peering and Transit example

Cisco/ISPWorkshops

8

Autonomous System (AS)

- Collection of networks with same routing policy
- Single routing protocol
- Usually under single ownership, trust and administrative control
- Identified by a unique number

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

9

Autonomous System Number (ASN)

- An ASN is a 16 bit number
 - 1-64511 are assigned by the RIRs
 - 64512-65534 are for private use and should never appear on the Internet
 - 0 and 65535 are reserved
- 32 bit ASNs are coming soon
 - www.ietf.org/internet-drafts/draft-ietf-idr-as4bytes-07.txt
- ASNs are distributed by the Regional Internet Registries
 - Also available from upstream ISPs who are members of one of the RIRs
 - Current ASN allocations up to 32767 have been made to the RIRs

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

10

Demarcation Zone (DMZ)

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

11

BGP Basics

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

12

BGP General Operation

- Learns multiple paths via internal and external BGP speakers
- Picks the best path and installs in the forwarding table
- Policies applied by influencing the best path selection

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

13

Constructing the Forwarding Table

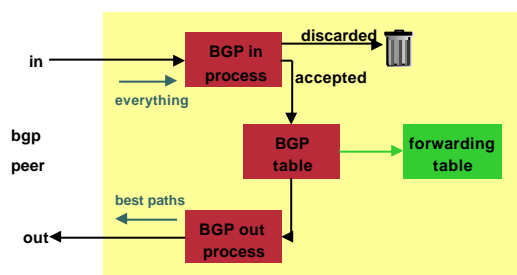

- BGP “in” process
 - receives path information from peers
 - results of BGP path selection placed in the BGP table
 - “best path” flagged
- BGP “out” process
 - announces “best path” information to peers
- Best paths installed in forwarding table if:
 - prefix and prefix length are unique
 - lowest “protocol distance”

Cisco/ISPWorkshops

15

eBGP & iBGP

- BGP used internally (iBGP) and externally (eBGP)
- iBGP used to carry
 - some/all Internet prefixes across ISP backbone
 - ISP's customer prefixes
- eBGP used to
 - exchange prefixes with other ASes
 - implement routing policy

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

16

BGP/IGP model used in ISP networks

- Model representation

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

17

External BGP Peering (eBGP)

- Between BGP speakers in different AS
- Should be directly connected
- **Never** run an IGP between eBGP peers

Cisco/ISPWorkshops

18

Configuring External BGP

Router A in AS100

```
interface ethernet 5/0
ip address 222.222.10.2 255.255.255.240
!
router bgp 100
network 220.220.8.0 mask 255.255.252.0
neighbor 222.222.10.1 remote-as 101
neighbor 222.222.10.1 prefix-list RouterC in
neighbor 222.222.10.1 prefix-list RouterC out
!
```

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

19

Configuring External BGP

Router C in AS101

```
interface ethernet 1/0/0
ip address 222.222.10.1 255.255.255.240
!
router bgp 101
network 220.220.8.0 mask 255.255.252.0
neighbor 222.222.10.2 remote-as 100
neighbor 222.222.10.2 prefix-list RouterA in
neighbor 222.222.10.2 prefix-list RouterA out
!
```

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

20

Internal BGP (iBGP)

- BGP peer within the same AS
- Not required to be directly connected
 - IGP takes care of inter-BGP speaker connectivity
- iBGP speakers need to be fully meshed
 - they originate connected networks
 - they do not pass on prefixes learned from other iBGP speakers

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

21

Internal BGP Peering (iBGP)

- Topology independent
- Each iBGP speaker must peer with every other iBGP speaker in the AS

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

22

Peering to Loop-back Address

- Peer with loop-back address
 - Loop-back interface does not go down – ever!
- iBGP session is not dependent on state of a single interface
- iBGP session is not dependent on physical topology

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

23

Configuring Internal BGP

Router A in AS100

```
interface loopback 0
ip address 215.10.7.1 255.255.255.255
!
router bgp 100
network 220.220.1.0
neighbor 215.10.7.2 remote-as 100
neighbor 215.10.7.2 update-source loopback0
neighbor 215.10.7.3 remote-as 100
neighbor 215.10.7.3 update-source loopback0
!
```

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

24

Configuring Internal BGP

Router B in AS100

```
interface loopback 0
ip address 215.10.7.2 255.255.255.255
!
router bgp 100
network 220.220.1.0
neighbor 215.10.7.1 remote-as 100
neighbor 215.10.7.1 update-source loopback0
neighbor 215.10.7.3 remote-as 100
neighbor 215.10.7.3 update-source loopback0
!
```

ip address on
loopback interface

Local ASN

Local ASN

ip address of Router A
loopback interface

25

Inserting prefixes into BGP

- Two ways to insert prefixes into BGP
 - redistribute static
 - network command

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

26

Inserting prefixes into BGP – redistribute static

- Configuration Example:

```
router bgp 100
redistribute static
ip route 222.10.32.0 255.255.254.0 serial10
```
- Static route must exist before redistribute command will work
- Forces origin to be “incomplete”
- Care required!

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

27

Inserting prefixes into BGP – redistribute static

- Care required with **redistribute**!
 - redistribute <routing-protocol> means everything in the <routing-protocol> will be transferred into the current routing protocol
 - Will not scale if uncontrolled
 - Best avoided if at all possible
 - redistribute normally used with “route-maps” and under tight administrative control

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

28

Inserting prefixes into BGP – network command

- Configuration Example

```
router bgp 100
network 222.10.32.0 mask 255.255.254.0
ip route 222.10.32.0 255.255.254.0 serial10
```
- A matching route must exist in the routing table before the network is announced
- Forces origin to be “IGP”

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

29

Configuring Aggregation

- Three ways to configure route aggregation
 - redistribute static
 - aggregate -address
 - network command

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

30

Configuring Aggregation

- **Configuration Example:**

```
router bgp 100
 redistribute static
 ip route 222.10.0.0 255.255.0.0 null0 250
```
- **static route to "null0" is called a pull up route**
packets only sent here if there is no more specific match in the routing table
distance of 250 ensures this is last resort static
care required – see previously!

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

31

Configuring Aggregation – Network Command

- **Configuration Example**

```
router bgp 100
 network 222.10.0.0 mask 255.255.0.0
 ip route 222.10.0.0 255.255.0.0 null0 250
```
- **A matching route must exist in the routing table before the network is announced**
- **Easiest and best way of generating an aggregate**

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

32

Configuring Aggregation – aggregate-address command

- **Configuration Example**

```
router bgp 100
 network 222.10.32.0 mask 255.255.252.0
 aggregate-address 222.10.0.0 255.255.0.0 [ summary-only ]
```
- **Requires more specific prefix in routing table before aggregate is announced**
- **{summary-only} keyword**
optional keyword which ensures that only the summary is announced if a more specific prefix exists in the routing table

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

33

Historical Defaults – Auto Summarisation

- **Disable historical default 1**
- **Automatically summarises subprefixes to the classful network when redistributing to BGP from another routing protocol**

Example:

61.10.8.0/22 ® 61.0.0.0/8

- **Must be turned off for any Internet connected site using BGP**

```
router bgp 100
 no auto-summary
```

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

34

Historical Defaults – Synchronisation

- **Disable historical default 2**
- **In Cisco IOS, BGP does not advertise a route before all routers in the AS have learned it via an IGP**
- **Disable synchronisation if:**
AS doesn't pass traffic from one AS to another, or
All transit routers in AS run BGP, or
iBGP is used across backbone

```
router bgp 100
 no synchronization
```

Cisco/ISPWorkshops

© 2004, Cisco Systems, Inc. All rights reserved.

35

Summary

- **BGP4 – path vector protocol**
- **iBGP versus eBGP**
- **stable iBGP – peer with loopbacks**
- **announcing prefixes & aggregates**
- **no synchronization & no auto-summary**
